

Dieselspektor

Analyze the refueling of the entire fleet in 5 minutes

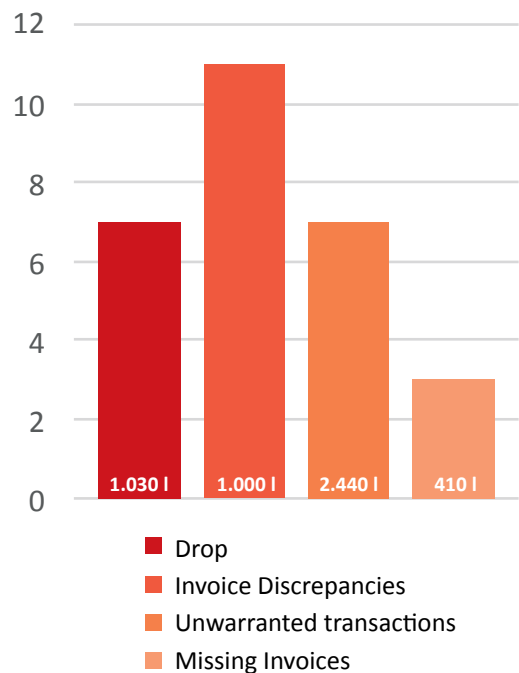

Exact monitoring of diesel purchase and consumption is a difficult task for transportation companies. Manual analysis quickly devours many work hours per month without achieving a meaningful result as the possible causes of an elevated average consumption are too varied. The Dieselspektor software combines vehicle data and fuel transactions and automatically highlights problematic incidents, such as theft or incorrect billing, independent from outside influences.

With Dieselspektor, you can...

- efficiently analyze the diesel consumption of the entire fleet
- automatically detect theft out of the tank and at the gas pump
- detect vehicles that report their fuel consumption incorrectly
- detect wrong fuel bills
- assess means to reduce fuel consumption based on drivers and vehicles

The Dieselspektor works...

- through automatic analysis of fuel bills and vehicle data
- independently from tour profile and average consumption
- without additional hardware, but with current telematics systems
- with all fuel cards and their data formats
- also with vehicles with double-sided fuel tanks

Dieselspektor results for one month in a fleet of 60 trucks

“Diesel Inspector automatically provides us with a detailed analysis of our refueling transactions and consumption. Through this, we can recognize problems and take action against them without great effort.”
